

Securing your business assets

Protect your business assets by gaining control of your requirements for:

Compliance

Threats

Optimization

We are dedicated to deliver customer focused applications within IT security and in particular Log Management. We have a long history of being a partner to our customers – we listen and we adapt continuously. We strive to create software solutions characterized by ease of deployment, ease of use and ease of management and with great support.

LogInspect has a strong build-in report generator – for easy compliance documentation or custom build requirements.

ImmuneSecurity

We have our heritage from Scandinavia and we are an agile organisation focused on securing assets in businesses and organisations - we are a company of dedicated employees supporting our customers in achieving their goals within Compliance, IT security and IT operational excellence.

LogInspect is transforming SIEM solutions into real business value.

Most organizations today realize and accept that a Log Management solution has clear business value – automation of regulatory processes, improved efficiency of forensic investigations, increased troubleshooting turnaround times and an overall better security position.

LogInspect is a platform that extracts intelligent events and incidents from the million of logs that today exists in an IT infrastructure of any size. The filtered and carefully correlated results are displayed in easy to manage Dashboards that are user configurable depending on roles and responsibilities.

Return on investment is key:

- LogInspect deliver valuable need-to-have documentation for compliance, delivered in easy to understand and configurable reports...
- LogInspect is a must-have security tool to protect your business assets from threats from IT Security breaches in your network...
- LogInspect deliver in depth gauges on the effectiveness of any IT infrastructure – highlighting areas to optimize and reduce costs...
- LogInspect deployment is easy, intuitive, secure and users adapt at any level very fast - and enjoy (!) browsing in the carefully designed Dashboards...

ImmuneSecurity will prove ROI in less than 6 months.

LogInspect collect and store data from any source...

- LogInspect gives you the opportunity to have a secure, centralized log archive that automatically analyzes log messages in real-time. The log consolidation and the safe storage of evidences give you a single interface to access and manage all your information. The secure archive will ensure that you won't lose any log messages because of a system crash or a hacker compromise.

LogInspect analyze and alert automatically

- The built-in intelligent log analysis engine will automatically detect and notify you when a critical event has been detected. Events monitored could be an ongoing attack, a compromised system, a system breakdown or user authentication.

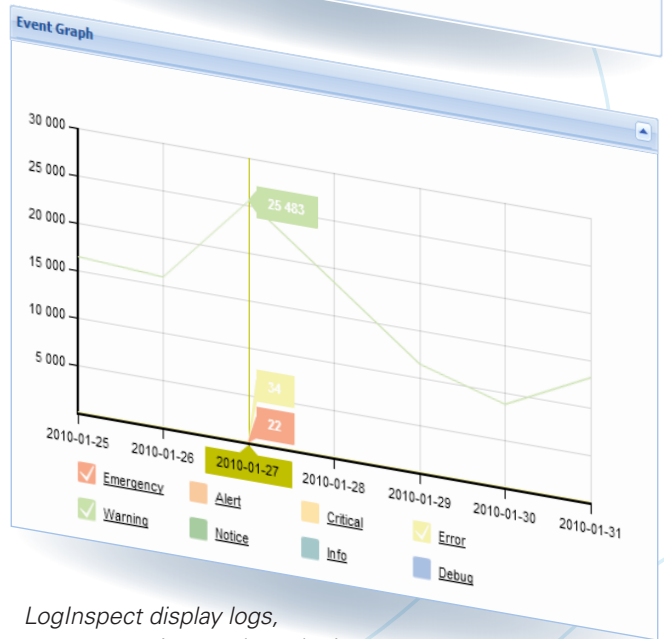

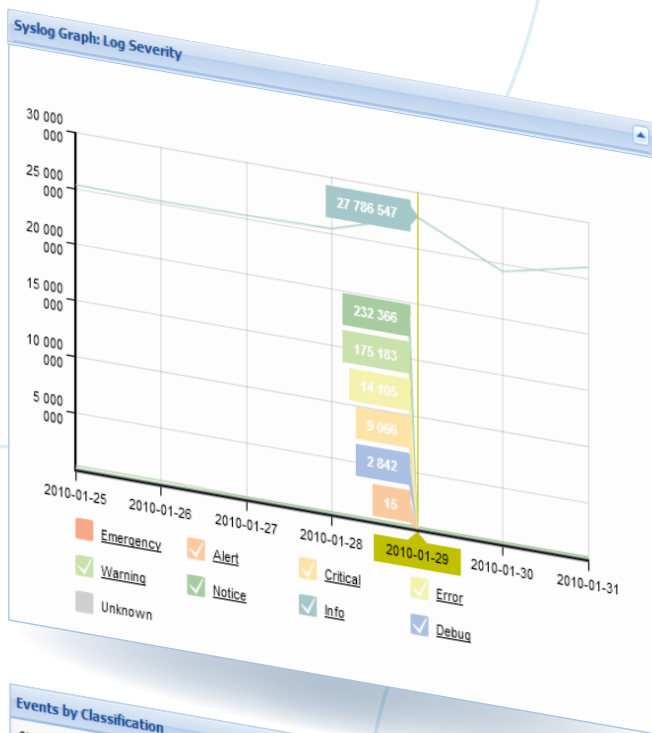

LogInspect - The Dashboards

- Security Event Management is much more valuable if the information collected can be presented and reached with less effort. LogInspect represents information in structured overview which allows you to quickly spot new trends and dig deeper into relevant information.

LogInspect - Auditing and Compliance made easy

- LogInspect can help you achieve a complete insight to your network, and help meeting common regulations. LogInspect provides pre-built templates for most common compliance and security reports.

LogInspect display logs, events, matrixes and graphs in easy to configure widgets.

Implemented in LogInspect:

Risk Assesment

Confidentiality, Integrity, Availability (CIA). This well known model enable operational implementation of a calculated threat impact scoring – bringing focus on the most important events first

Dashboard – for ease of control

Advanced Dashboard technology – based on WEB 2.0 – allow the users to individually configure the Dashboards to reflect exactly the desired views depending on the users role in an organisation. The Dashboards display critical Events and Security Incidents real-time.

Event Correlation

LogInspect Event Correlation Engine can detect patterns of events, like multiple failed user account logins followed by a successful login from same user will trigger an “Attempted Bruteforce Login” event.

LogInspect Network Abnormally Detection Engine (NADE) can trigger an event on patterns detected in the network flow. E.g. detection of “Possible infected Spam Host” just by looking on the network communication behavior.

Active Respons Engine

Allow users to receive e-mail on detected security incidents. Allow for automatic system triggers on certain event i.e. blocking an IP in the Firewall or shutting down users if suspicious security incidents occur.

Open Rule Framework

The framework we are using to create rules is open for all users, this allows sharing and creating additional rules per requirement including signatures for Correlation, Log Signature or NADE. LogInspect comes with ImmuneSecurity Certified Signatures. New rules are automatically updated to LogInspect when available.

Reporting out-of-the box

Standard reporting templates for Compliance reports like PCI, SOX, DS-484, HIPPA and more are part of the standard version of LogInspect – this templates can be modified or created from scratch using an intuitive LogInspect Report Wizard.

System requirements

LogInspect is delivered as pre-configured appliances but can also run smoothly in VMware environments. The actual hardware configuration can be seized for each customer.

The Licensmodel

The software is licensed based on a yearly fee that include all new upgrades, patches, signature subscriptions as well as e-support via the ImmuneSecurity Ticket System.

**ImmuneSecurity
Managed Services ...
going the extra mile with
SIEM professionals**

A LogInspect SIEM solution is complexity made easy – however implementing and maintaining the benefits from LogInspect involves resources and dedication. Many organisations have discovered further benefits by engaging ImmuneSecurity professionals to manage the reporting and management of the LogInspect analyses and alerts.

This tailored managed service is typically delivered on a weekly, monthly or quarterly basis
